- Trends in Mortality Rate	

INTRODUCTION

This 1988 report is the twelfth in a series begun in 1977. In this report demographic birth and death data are presented for each health region. The information is more detailed than that presented in the Vital Statistics Annual Report. The summary statistics are age-specific or age-standardized. They are therefore more appropriate for epidemiological considerations.

We welcome suggestions from the reader for improvements to incorporate in this report. Please forward suggestions to:

DEFINITIONS

Covered Population	- is the population possessing active Health Registration cards (it excludes members of the armed forces and the RCMP). Geographic location is determined by mailing address and so may under-estimate rural areas in favour of adjoining towns or villages. The 1988 covered population data were about 3% higher than census figures. The difference was greater in the ages less than 25 and in Towns and Villages.
Sex Ratio	- is the number of males per 1,000 females.
Youth Dependency Ratio	- is the ratio of the population less than 15 to the population 15-64.
Aged Dependency Ratio	- is the ratio of the population 65 and over to the population 15-64.
Total Dependency Ratio	- is the ratio of the population less than 15 or 65 and over to the population 15-64.
Birth Rate	- is the number of births per 1,000 females in the specified age group.

Fertility Rate - is the sum of the Age Specific Fertility Rates multiplied by 5. This number represents the births one would expect in a cohort of 1,000 females in their lifetime if the present rates continued. A rate of 2,000 approximately corresponds to zero population growth (migration).

Death Rates - is the number of deaths per 100,000 population in the age group.

Cause of Death - is assigned by a physician at time of death. The groupings used here are based on ICD (9th Rev.).

Note that "perinatal deaths" as used here refers to ICD codes in the range 760 - 779 and the rates are per 100,000 population. This is different from the usual perinatal death rate which is the first 7 days of life per total births (still or live born).

Crude Rates - is the number of deaths per 100,000 population; this figure is affected by the age/sex distribution of the population and is not comparable between regions.

Age Standardized Rates - is the death rate the region would experience if it had the age/sex distribution of a standard population. It is comparable between regions.
The rates here are standardized to Canada's population for 1976.

Life Expectancy - is calculated using age-specific mortality rates for five year age groups. It is the average age at death of a cohort born today if the present mortality rate continued.

PYLL - is 'Potential Years of Life Lost' and represents the number of years lost due to premature death (before the age of 70).
The crude rate is the number of PYLL before 70 per 1,000 population aged less than 70.
The age standardized rate adjusts the crude rate for the age/sex composition of the population less than 70.

STATISTICAL NOTES

The statistics presented in this report are subject to random fluctuation. Therefore, when comparing the rates between two regions, it is important to differentiate between substantive differences and differences attributable to chance. This is particularly so when the rate is based on a relatively small population or addresses a relatively rare condition.

Age specific birth rates and death rates for different regions can be compared, but the precision of these calculated rates must be considered. The following rule of thumb should be kept in mind. The precision of the crude rate (birth or death) is based on the number of vital events (the numerator):

- if there were 400 or more vital events the rate is reasonably accurate to $\pm$ 10% and can be interpreted with some confidence.
- if there were 100 vital events the precision is $\pm$ 20% and some caution is advised.
- if there were 25 vital events the precision is $\pm$ 40% and interpretation should be guarded.

These levels of precision are based on 95% confidence intervals.

Age Standardized Death Rates are more precise than Crude Rates calculated on the same figure. While precision can be calculated for any estimated value, no general rule of thumb exists to facilitate this.
